

Task 6

Prepared by :- Nandana Silju

Gophish (Phishing framework)

Objective:-

Run Gophish in a VM and with screenshots make a report of what happened.

Here I used Windows as host OS and Kali Linux as VM guest OS.

Downloaded , extracted and run Gophish on the Kali VM.

```
kali@kali:~/tools$ cd tools
kali@kali:~/tools$ cd gophish
kali@kali:~/tools/gophish$ ./gophish

```

Accessed the admin UI on the VM and configured a sending profile using Gmail SMTP.

Created an email template with the subject: " Two step verification on instagram", and a tracking link to a landing page.

Created a credential-capture landing page designed as Instagram login page(for testing only).

Prepared a target list with a single test account.

Launched the campaign named "Cronus".

Here a mail was send to Victim.

While the victim try to login:

It will be out put from website

Here the attacker gets the details of victim.

- Number of recipients in target list: 1
- Emails sent: 1
- Emails delivered: 1
- Emails opened: 1
- Links clicked: 1

Findings

Gophish functioned correctly on the Kali VM, and the Gmail SMTP profile successfully sent messages to the test account.

The credential-capture landing page accepted a test submission without issue, illustrating how attackers could harvest credentials from unsuspecting users.

Throughout the test, no errors, SMTP failures, or provider warnings were encountered.

Summary

I ran a one-target phishing test called “Instagram” in a Kali Linux VM using Gophish and Gmail SMTP. A realistic credential-capture page was able to collect a test user’s login details after they interacted with the email. This shows why regular phishing drills and user training are important. Suggested defenses: set up SPF/DKIM/DMARC, teach users how to spot phishing, and provide a clear way to report suspicious emails.
