

Recent DDos Attacks

1. The 7.3 Terabit Onslaught: A Record-Breaking Wave

The Target: A major hosting provider, cloudflare was attacked with an onslaught of 7.3 Terabit per second DDoS attack..

The Attack: In mid-May 2025, cloudflare was hit with the largest DDoS attack ever recorded: a staggering 7.3 terabits per second. It was a multi-pronged assault, but almost all of it was a simple, brute-force flood of junk data. The attack was launched from a massive global botnet of over 122,000 devices spread across 161 countries, showcasing the incredible power modern attackers can command.

The Motive: While no one claimed responsibility, an attack of this scale isn't about a quick payday. It was likely a raw demonstration of power—either a nation-state testing the internet's defenses or a major criminal group flexing its muscles to attract high-paying clients.

The Impact: Despite the unprecedented size of the attack, the impact on the target was nothing (Thankfully everything was safe). The hosting provider experienced zero downtime. Their security service, which was "always-on," automatically detected and blocked the entire flood of malicious data at the edges of the network, before it could ever reach its target. The real impact was the message it sent to the world: this is the new scale of the threat we all face.

The Lesson: An "always-on," automated defense that can react at machine speed is no longer a luxury; it's a necessity for survival.

2. Adyen Under Siege

- **Target:** Adyen, major European payment processor for global companies.
- **Attack:** Three smart DDoS waves mimicking real transactions to overload servers.
- **Motive:** Likely financial—ransom, sabotage, or distraction for fraud.
- **Impact:** 9-hour outage; major payment disruptions across Europe.
- **Lesson:** Defense must be automatic and adaptive, not manual.

3. NATO Summit Offensive

- **Target:** Dutch government and NATO websites during NATO Summit (July 2025).
- **Attack:** DDoSia-powered volunteer network by pro-Russian group *NoName057(16)*.
- **Motive:** Political retaliation for Netherlands' support of Ukraine.
- **Impact:** Temporary outages; propaganda win for attackers.
- **Lesson:** High-profile events are prime targets—need proactive threat intelligence.

4. The “Cyber Price Tag”

- **Target:** U.S. universities and financial firms tied to Israel.
- **Attack:** DDoS, website defacement, and data theft threats by pro-Palestinian groups.
- **Motive:** Ideological—punish institutions for political/financial policies.
- **Impact:** Potential major academic and financial disruptions.
- **Lesson:** Defenses must include both technical response and crisis communication.

5. Unmasking Anonymous Sudan

- **Target:** Global tech firms, airports, and hospitals.
- **Attack:** Advanced DDoS-for-hire service using custom-built tools.
- **Motive:** Claimed hacktivism; actually a profit-driven criminal operation.
- **Impact:** Over \$10M in damages; hospital ER shutdown endangered lives.
- **Lesson:** Major threats come from organized cybercrime—requires joint law enforcement action.
