

Task 6 - Phishing

Introduction

This report details a simulated phishing campaign conducted using GoPhish, designed exclusively for educational purposes. The objective of this exercise was to understand the mechanics of phishing attacks, evaluate the susceptibility of users to such attacks, and identify areas for improvement in security awareness training. This campaign was carried out in a controlled environment and did not target actual individuals without their explicit consent.

Campaign Overview

The simulated phishing campaign involved setting up a realistic-looking phishing page and sending a carefully crafted email to a controlled group of participants who were aware of the educational nature of the exercise.

Campaign Details

Aspect	Description
Platform Used	GoPhish
Target Audience	A controlled group of volunteers
Campaign Dates	26/10/2025
Phishing Template Used	insta

Methodology

Email Design

The phishing email was designed to mimic a common corporate communication, such as a password reset request or a notification from a legitimate service. Key elements included:

- **Sender Address:** A seemingly credible, but spoofed, sender address.
- **Subject Line:** Urgent and attention-grabbing to encourage opening.
- **Content:** Text that prompted immediate action, often involving clicking a link.

- **Call to Action:** A clear instruction to click a link that led to the simulated phishing page.

Landing Page Setup

A GoPhish landing page was configured to replicate a login portal for a commonly used service. This page was designed to capture credentials if entered by the participants. No actual sensitive data was collected or stored.

Sending and Monitoring

The emails were sent through GoPhish, which also provided tracking capabilities for:

- Emails sent
- Emails opened
- Links clicked
- Data submitted (credentials, if any)

Results

This mail was received in my system.
