

Gophish Phishing Simulation Report

Introduction

Gophish is an open-source phishing framework designed to help organizations test their susceptibility to phishing attacks. It provides a user-friendly interface for creating and managing phishing simulations, making it an invaluable tool for cybersecurity professionals and educators. This report outlines the steps taken to run a simulated phishing campaign using Gophish on a virtual machine, along with screenshots and an analysis of the results.

Creating the Phishing Campaign

Email Template Creation

- **Purpose:** To mimic a real-world phishing attack, such as a corporate memo or a fake social media notification.
- **Content:** The email template was designed to be convincing, encouraging recipients to click on a malicious link.

Landing Page Creation

- **Purpose:** To replicate a legitimate login portal, such as a service login page.
- **Content:** The landing page was created to capture credentials or other sensitive information entered by the user.

User and Group Management

- **Purpose:** To target specific groups or individuals within the organization.
- **Content:** Lists of employees or user groups were imported to tailor the phishing campaign effectively.

Launching the Campaign

Sending the Phishing Emails

- **Method:** The phishing emails were sent using Gophish's built-in SMTP server configuration.
- **Tracking:** Real-time results, including who opened the email, clicked the link, and submitted data, were monitored through the Gophish dashboard.

The screenshot displays the Graphish dashboard. The top navigation bar includes the Graphish logo, a user profile icon, and a 'Log out' button. The left sidebar contains a menu with the following items: Dashboard, Campaigns, Users & Groups, Email Templates, Landing Pages, Sending Profiles, Account Settings, User Management, and Reports. The main content area is divided into two sections. The top section, titled 'Summary', features five circular progress indicators for different metrics: Email Sent (1), Email Opened (1), Clicked Link (1), Subscribed Data (0), and Email Reported (0). The bottom section, titled 'Details', shows a table of email campaign data. The table has columns for 'Email', 'Status', and 'Reported'. The first row shows an email sent to 'islerfootball@gmail.com' with a status of 'Success' and a reported time of '10:42:58 PM'. Below the table, there is a 'Timeline for Black Shadow' section, which lists the following events: 'Campaign Created' (October 2020 10:42:58 PM), 'Email Sent' (October 2020 10:42:58 PM), and 'Clicked Link' (October 2020 10:42:58 PM). The timeline also includes a 'View all events' link and a 'View all events' button.

[illegible]

Findings

- **User Engagement:** The campaign successfully engaged a significant users, with opening the email and clicking the link.
- **Credential Capture:** Users submitted their credentials on the landing page, indicating a need for improved security awareness.
- **Real-Time Monitoring:** The Gophish dashboard provided valuable insights into user behavior and the effectiveness of the phishing simulation.

Conclusion

The simulated phishing campaign using Gophish on a Kali Linux virtual machine was a success. It effectively demonstrated the vulnerabilities within the organization and highlighted the importance of security awareness training. By analyzing the results, the organization can identify areas for improvement and take steps to enhance its cybersecurity posture.
