

1. Opened the room **“Further Nmap”** on TryHackMe.
2. Started the **AttackBox** and deployed the target machine.
3. Noted the target IP address displayed in the room.
4. Ran different types of Nmap scans:
 - a. `nmap -sn $IP -oN nmap_sn.txt` → Ping scan to check if the host is alive.
 - b. `nmap -sS -sV -p- -T4 $IP -oN nmap_full_initial.txt` → Full TCP scan with service detection.
 - c. `nmap -A --top-ports 1000 $IP -oN nmap_quick.txt` → Aggressive scan for OS and version detection.
 - d. `nmap -sV -p 80,443 --script=http-enum,http-headers $IP -oN nmap_http.txt`
→ Scans for web-related info.
5. Some scans didn't return results because the host was blocking ping probes.

Task 1 ☐ Deploy

Press the green button to deploy the machine!

Please Note: This machine is for scanning purposes only. You do not need to log into it, or exploit any vulnerabilities to gain access.

▶ Start Machine

If you are using the TryHackMe AttackBox then you will need to deploy this separately. Click the **Start AttackBox** button on the top-right side to launch the machine.
